

Title: Evaluating ChatGPT as a Recommendation System: A Comprehensive Study

Short Description: This project aims to explore and evaluate the effectiveness of ChatGPT as a recommender system. It focuses on assessing ChatGPT's performance in various recommendation tasks such as rating prediction, sequential recommendation, and review summarization. Utilizing the Amazon Beauty dataset, the study combines prompt-based approaches and few-shot learning to gauge ChatGPT's abilities and limitations in generating personalized recommendations and explanations, providing insights into the potential applications and improvements for large language models in recommendation systems.
